WORLD PROMPT PACK

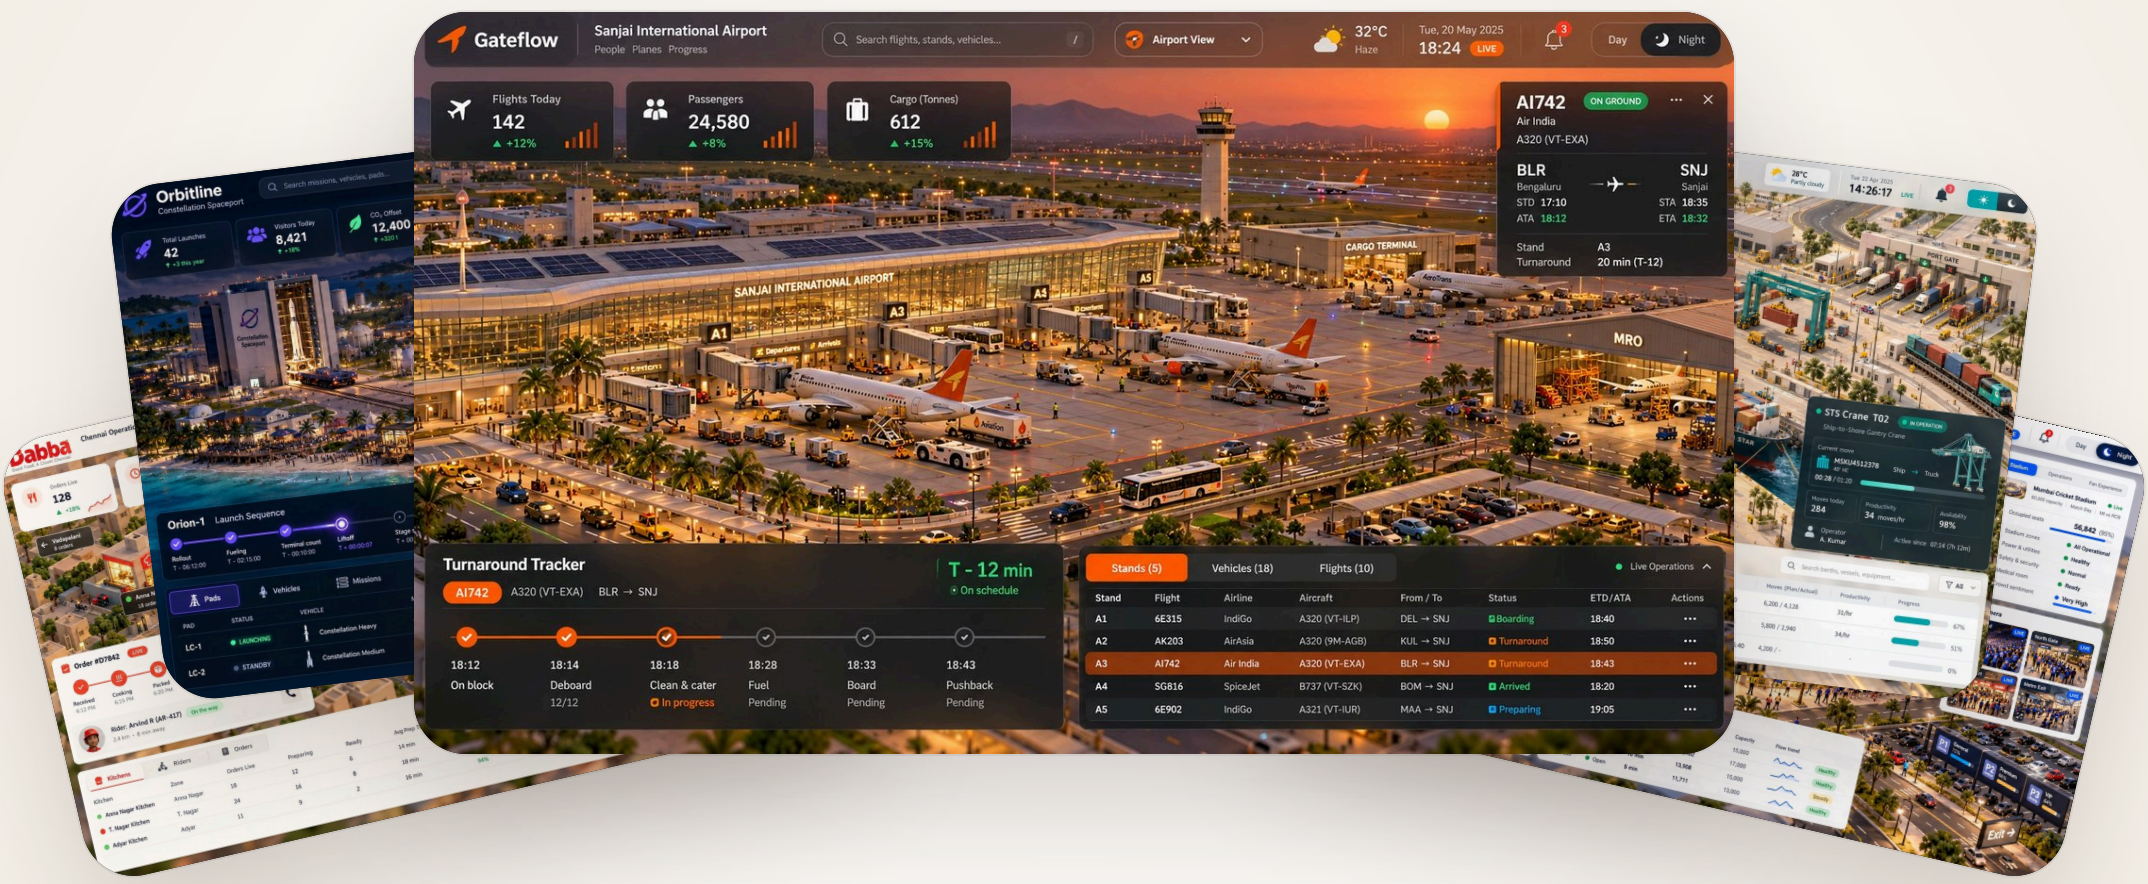

@sanjai.builds

Build any *world.*

17 copy-paste prompts that turn Claude into a 3D world builder. Living, clickable worlds that feel like strategy games.

Made with Claude Opus 4.5 · Single HTML file · Three.js

AIRPORT · SPACEPORT · PORT · STADIUM · AND 13 MORE

FREE GUIDE

@sanjai.builds

Every world is the *same 5 blocks.*

Learn the structure once and you can swap the world, the objects and the story. Each prompt in this pack follows this exact order.

1
WORLD
The place
What exists. Landmarks, buildings and vehicles, all built in code, plus one accent colour.

2
LIFE
The simulation
What moves on its own and loops forever. The secret line: everything gives way, nothing overlaps.

3
INTERACTION
The game feel
Pan, rotate, zoom. Click anything and the camera glides to it and follows it.

4
DASHBOARD
The interface
Frosted glass panels: top bar, 3 KPI cards, a tracker and a live table with realistic data.

5
EXTRAS
The wow
Seasons, weather and day/night. This is what makes people stop scrolling.

HOW TO USE IT

1
Copy
Pick a world and copy its whole prompt.

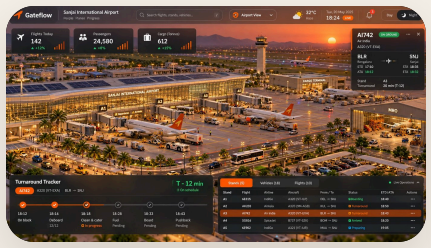

2
Paste
Paste it into Claude. Opus 5.5 gives the best first build.

3
Open
Claude writes one HTML file. Open it in your browser.

4
Remix
Ask for changes. The last page has follow-ups.

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 01 BUILT IN THE REEL

Airport apron control

Gateflow #FF6A1A

COPY THIS PROMPT PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D airport operations dashboard called "Gateflow" for "Sanjai International Airport" that feels like a strategy game.

WORLD: a low-poly isometric airport built entirely in code, no external models. Terminal with glass facade and 5 gates with jet bridges, a runway with edge lights, taxiways, control tower, cargo terminal with a freighter and ULD stacks, an open MRO hangar, a landside forecourt with a drop-off loop, car parks, a main road, palms and trees. A320-style planes with cabin windows, cockpit, winglets, engines, a tail logo and retractable gear. Clean toy-like clay look, soft shadows, one accent colour (#FF6A1A sunset orange) on warm off-white.

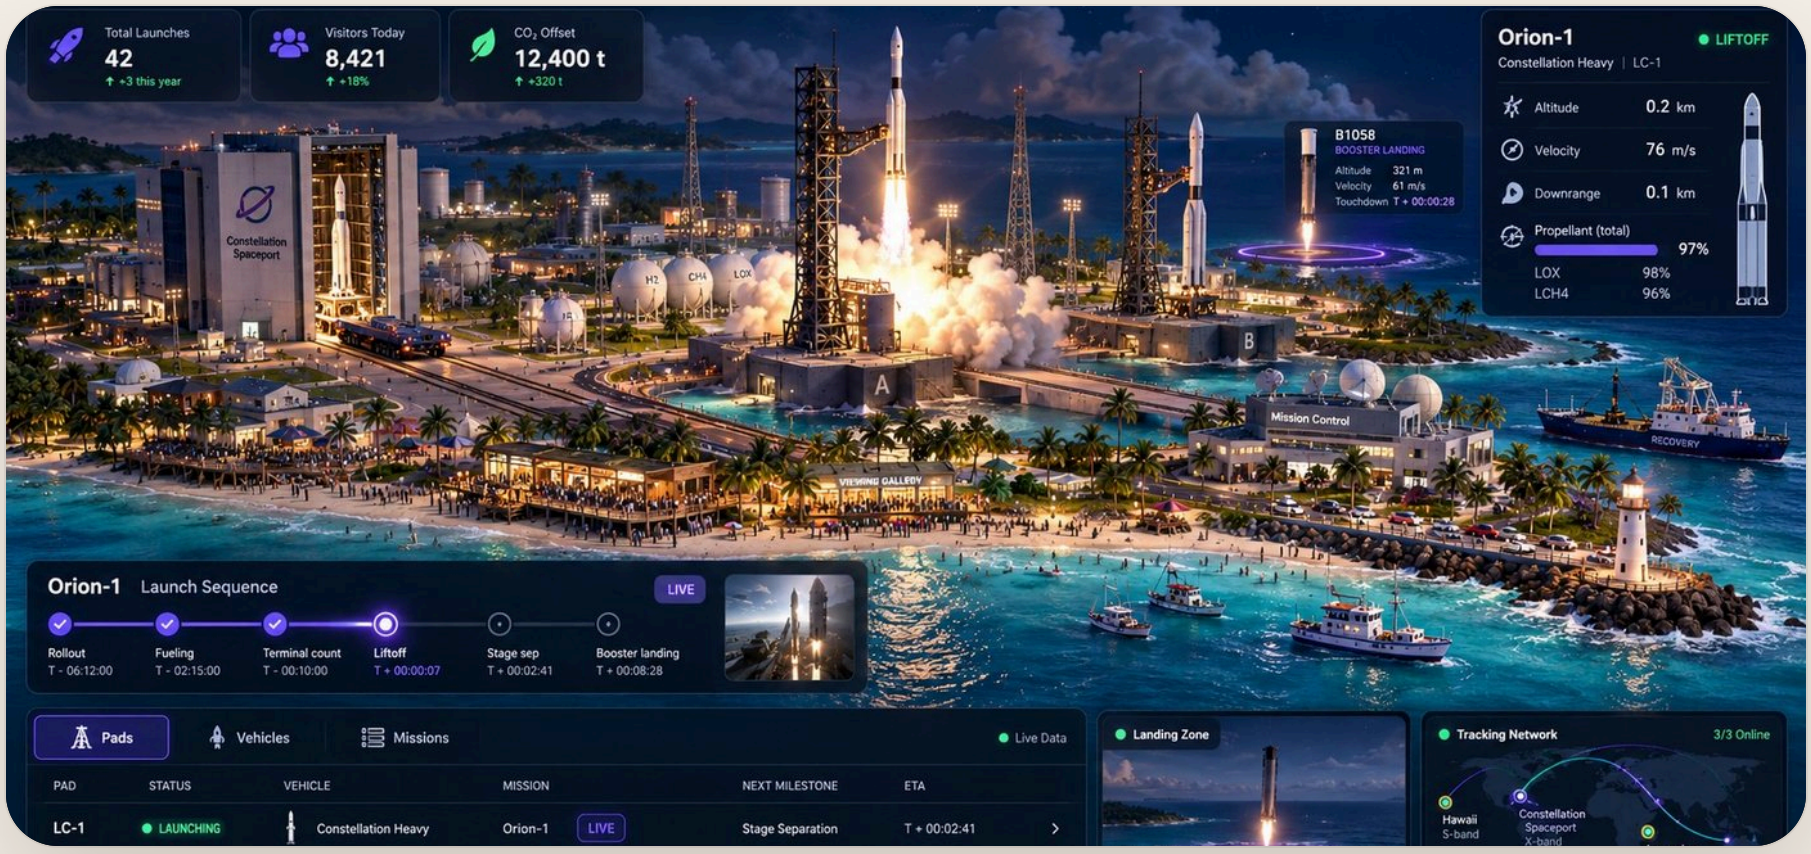

LIFE: two aircraft cycle forever on a shared schedule: land, taxi to a gate, run a turnaround, get pushed back by a tug that drives in, attaches, pushes and returns to its bay, taxi out and take off. Baggage tugs with carts, fuel dispensers, catering trucks whose box lifts to the door, crew buses and cargo forklifts follow curved routes and give way to aircraft and each other so nothing ever overlaps. Landside taxis, auto-rickshaws, cars and an airport bus follow car-following traffic and stop at the kerb.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any aircraft, vehicle or stand: the camera glides to it and follows if it moves, a pulsing ring and a floating label mark it, and a glass detail panel shows live stats. An area switcher flies between Terminal, Cargo, Hangar, Runway and Landside.

DASHBOARD: frosted glass panels over the 3D view: top bar (logo, search for any object, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards, a right detail panel, a bottom-left turnaround tracker (On block, Deboard, Clean and cater, Fuel, Board, Pushback with times) and a tabbed live table (Stands, Vehicles, Flights). Realistic data: flight numbers, registrations, fuel in tonnes, pax counts. No lorem ipsum.

EXTRAS: a seasons menu (Summer, Monsoon with rain, wet tarmac and lightning, Winter fog with low visibility, Snow with a de-icing truck spraying a plane) that changes light, fog, materials and particles; animated day/night with glowing windows, runway lights and floodlights; works on mobile with a bottom-sheet panel.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 02 BUILT IN THE REEL

Spaceport mission control

Orbitline #7C5CFF

COPY THIS PROMPT PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D spaceport dashboard called "Orbitline" for "Constellation Spaceport" on a tropical coast that feels like a strategy game.

WORLD: a low-poly isometric spaceport built entirely in code, no external models. Two launch pads with lattice towers, swing arms, water towers and floodlights, a tall vehicle assembly building with an open door, a gravel crawlerway, propellant sphere farms, mission control with tracking dishes, a landing zone with a glowing ring, a beach viewing gallery full of people, palms, a lighthouse, fishing boats and a recovery ship. A GPU ocean with Gerstner waves, turquoise shallows, foam crests and a shoreline that laps up the sand. Clean toy-like clay look, deep navy with one electric violet accent (#7C5CFF), dark mode first.

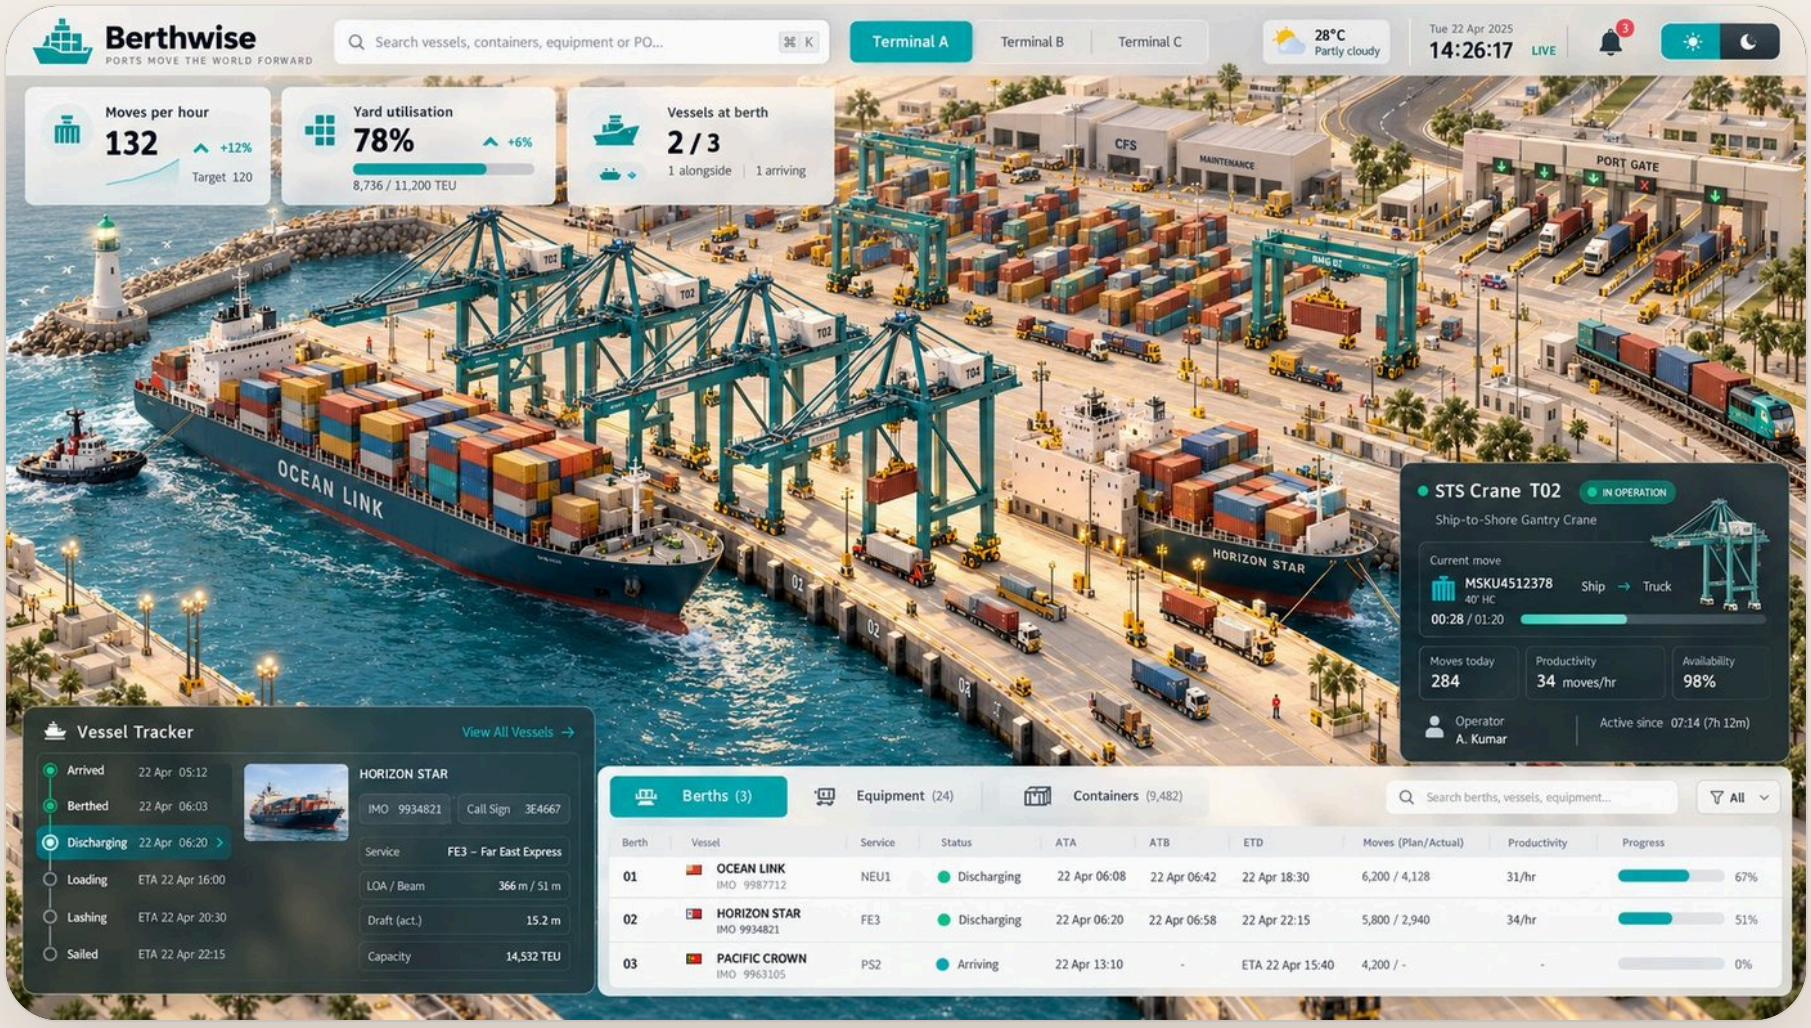

LIFE: one mission loops forever: a crawler carries the rocket out (a road barrier drops while it crosses), propellant loading with venting vapour, a T-minus countdown, ignition with a smoke cloud lit by the flame, liftoff with camera shake and a cheering crowd, stage separation with a smoke trail, then the booster flips, burns and lands upright on the landing zone with legs deployed. Tankers, a tour bus, crew vans and a security car give way to each other and to the crawler. Gulls circle the beach, clouds drift, palms sway.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click the rocket, booster, crawler, pads or any vehicle: the camera glides to it and follows it into the sky, a ring and label mark it, and a glass panel shows live telemetry (altitude, velocity, downrange, propellant). An area switcher flies between Pads, Assembly, Mission control, Landing zone and Coast.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, T-minus clock, alerts, day/night toggle, user), 3 KPI cards, a right detail panel, a bottom-left mission timeline (Rollout, Fueling, Terminal count, Liftoff, Stage sep, Booster landing with T-times) and a tabbed table (Pads, Vehicles, Missions). Realistic data: mission names, orbits, payload mass in kg.

EXTRAS: seasons (Clear skies with stars and moon, Monsoon with rain and lightning, Winter fog with visible floodlight beams), bioluminescent blue surf at night, animated day/night; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 03

Container port terminal

Berthwise #0FA3A3

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D container port dashboard called "Berthwise" that feels like a strategy game.

WORLD: a low-poly isometric port built entirely in code, no external models. A quay along animated water, two container ships stacked with coloured boxes, four ship-to-shore gantry cranes, a container yard with rubber-tyred gantries, a gate complex with booths and barriers, a rail siding with a container train, warehouses, a lighthouse. Clean toy-like clay look, soft shadows, one teal accent (#0FA3A3) on sandy off-white.

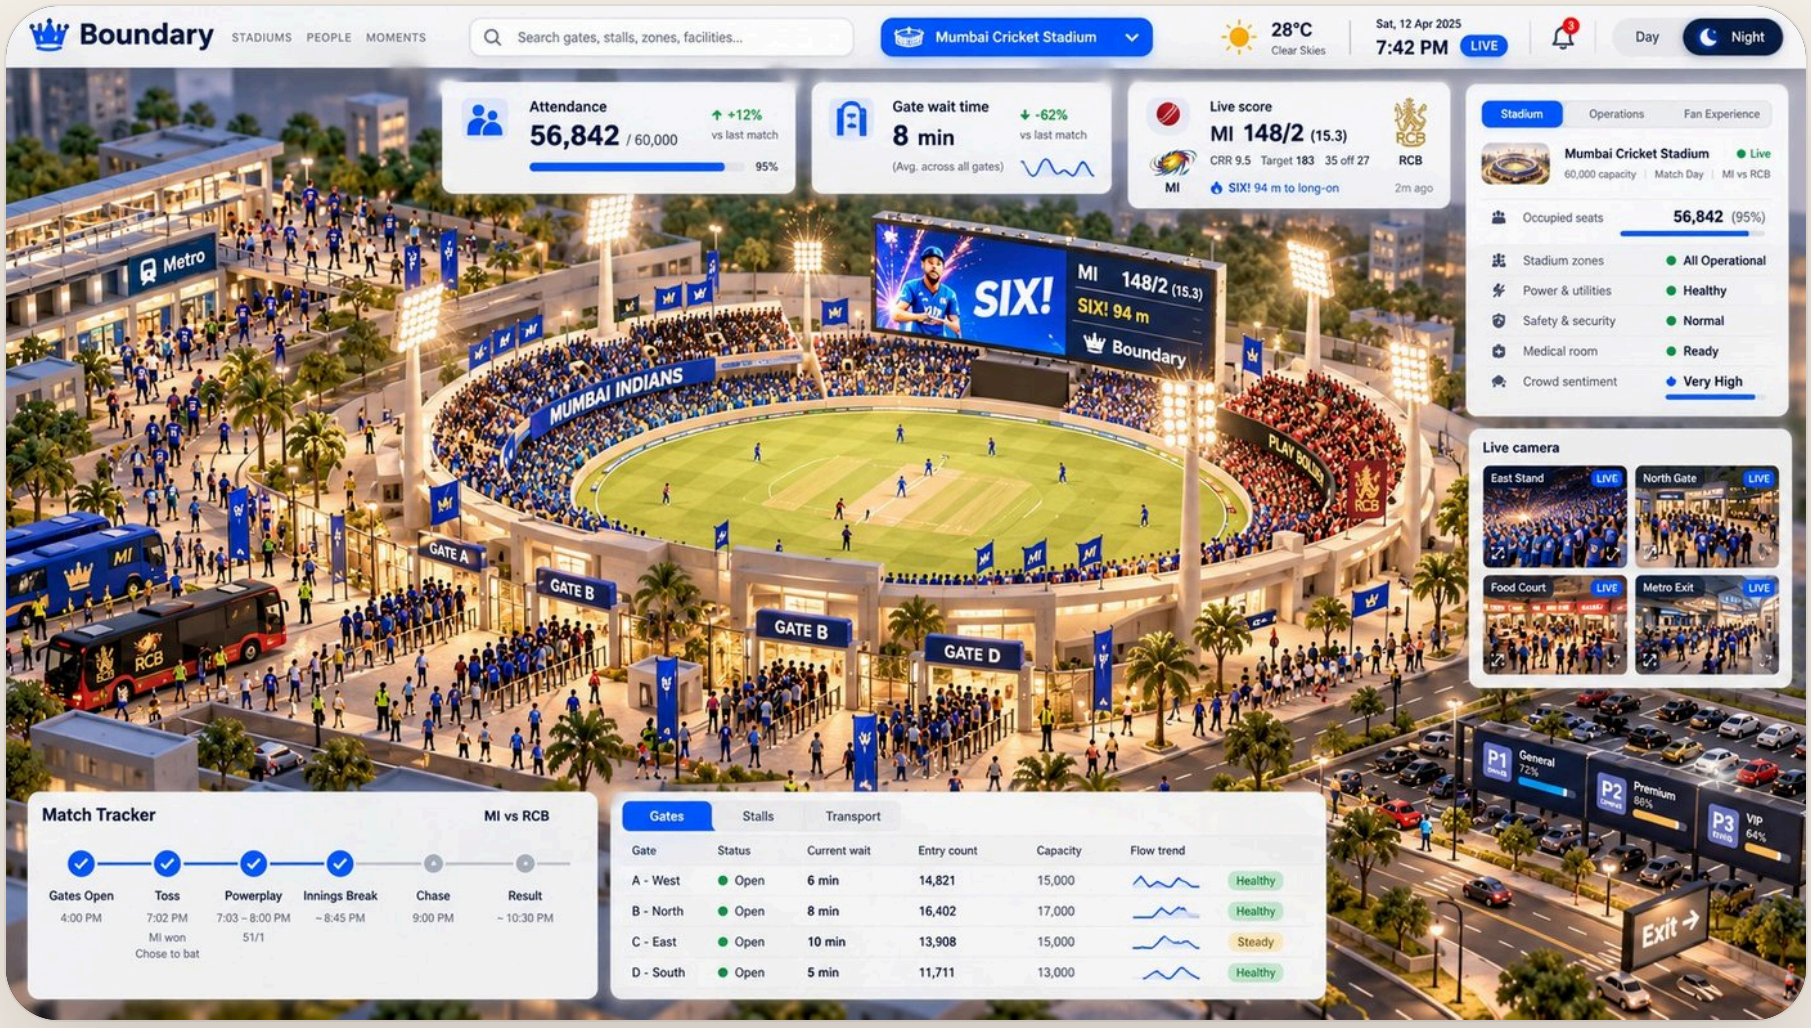

LIFE: everything loops on its own. A crane trolley lowers its spreader, lifts a container off the ship and sets it on a waiting terminal truck, which drives it to the yard where a gantry stacks it. A new ship arrives with a tug and docks. Trucks queue at the gate. All vehicles give way so nothing ever overlaps.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any ship, crane, truck or stack: the camera glides to it and follows it if it moves, a pulsing ring and label mark it, and a glass detail panel shows live stats. An area switcher flies between Berths, Yard, Gate and Rail.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Moves per hour, Yard utilisation, Vessels at berth), a right detail panel, a bottom-left vessel tracker (Arrived, Berthed, Discharging, Loading, Lashing, Sailed) and a tabbed table (Berths, Equipment, Containers). Realistic data: ISO container numbers, TEU counts, weights in tonnes.

EXTRAS: seasons (Clear, Monsoon with rough sea and rain, Fog, Storm with crane wind holds); animated day/night with crane lights and deck lights; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 04

Cricket stadium on match day

Boundary #1E5EFF

COPY THIS PROMPT

PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D stadium operations dashboard called "Boundary" for a cricket stadium on match day that feels like a strategy game.

WORLD: a low-poly isometric stadium built entirely in code, no external models. An oval ground with a pitch, tiered stands with thousands of instanced fans in team colours, four floodlight towers, a giant scoreboard, entry gates with turnstiles, food stalls, team buses, a parking lot, a metro station and roads around the stadium. Clean toy-like clay look, one accent colour (#1E5EFF blue) on warm white.

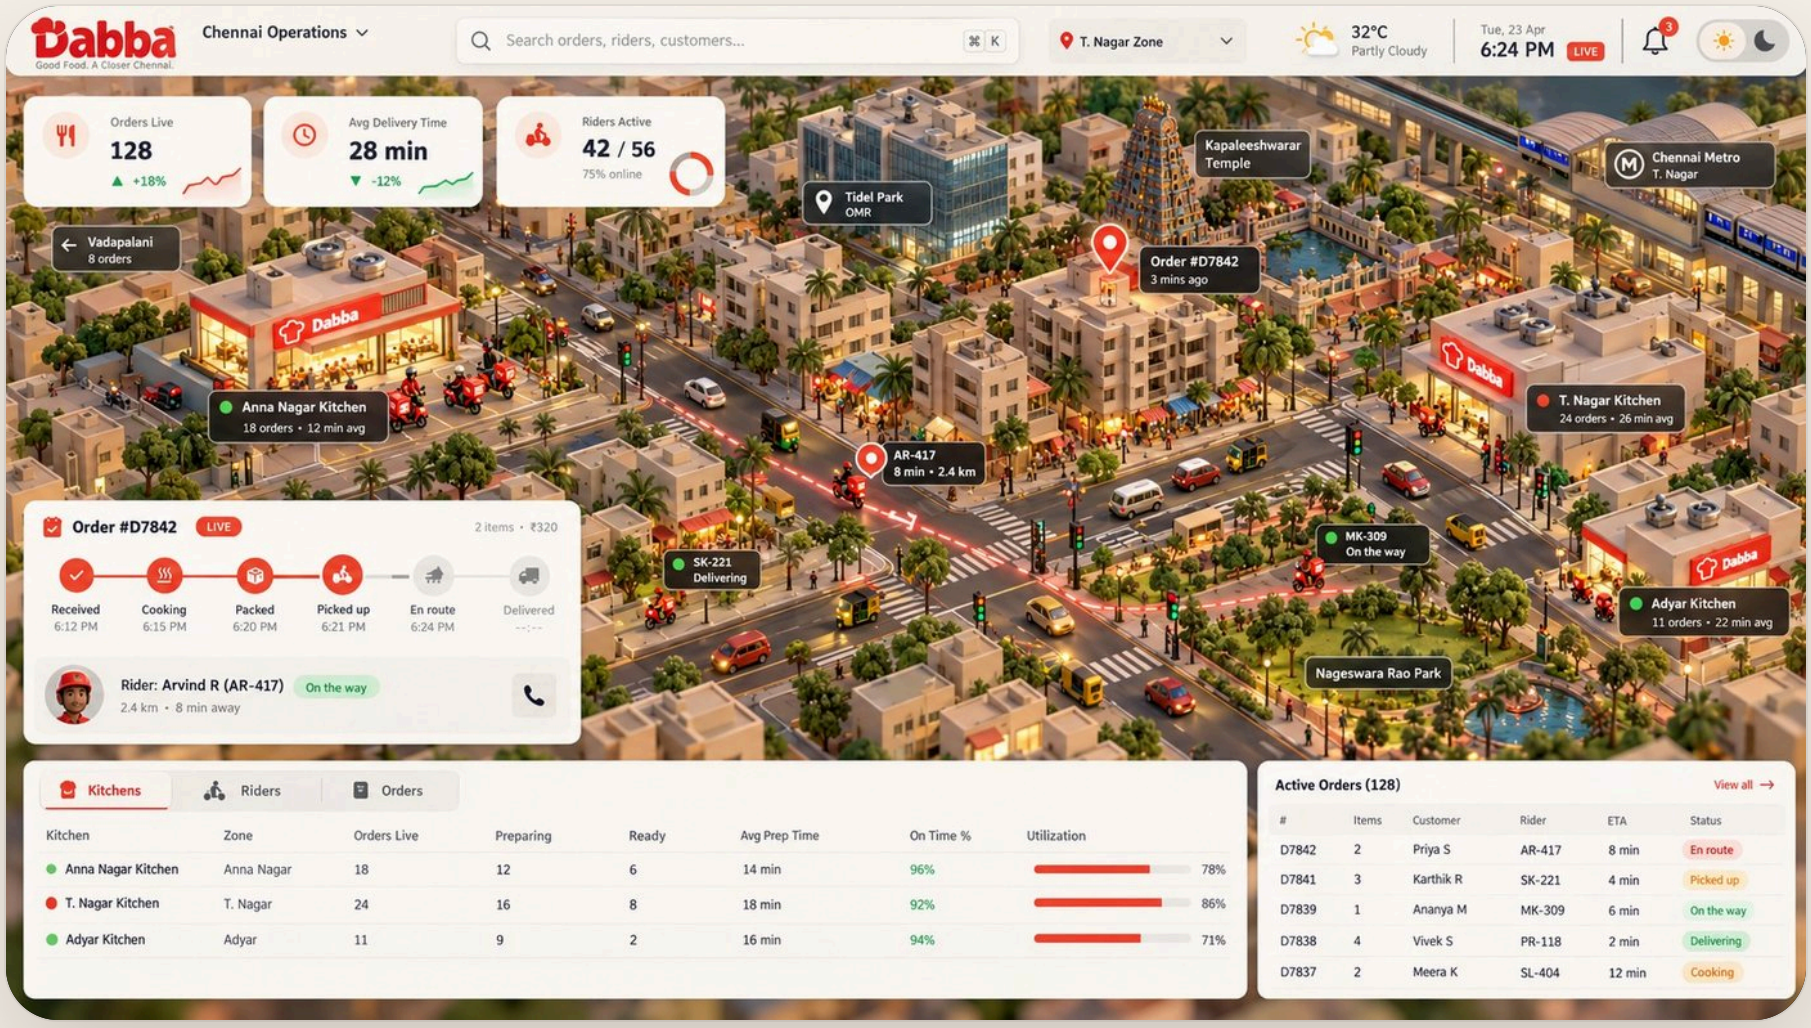

LIFE: fans stream from the metro and parking lots through the gates into the stands. Team buses arrive with an escort. On the field, a simple simulated match plays: bowler runs in, ball flies, fielders chase, and on a six the crowd jumps and the scoreboard updates. Food stall queues grow and shrink. Vehicles give way to each other and to crowds.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any gate, stand, stall, bus or the pitch: the camera glides there, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Field, Stands, Gates, Parking and Metro.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Attendance, Gate wait time, Live score), a right detail panel, a bottom-left match tracker (Gates open, Toss, Powerplay, Innings break, Chase, Result) and a tabbed table (Gates, Stalls, Transport). Realistic data: ticket scans, run rates, queue minutes.

EXTRAS: weather (Clear, Evening dew, Rain delay with covers rolling onto the pitch, Dusk), animated day/night with floodlights powering up in sequence; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 05

Cloud kitchen delivery city

Dabba #E8452C

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D food delivery operations dashboard called "Dabba" set in a Chennai-style neighbourhood that feels like a city-builder game.

WORLD: a low-poly isometric neighbourhood built entirely in code, no external models. A street grid with zebra crossings and traffic lights, three cloud kitchens with rooftop exhaust fans and rider bays, apartment blocks, offices, a tech park, small shops with awnings, a temple tower, a park and a metro station. Clean toy-like clay look, one tomato red accent (#E8452C) on warm off-white.

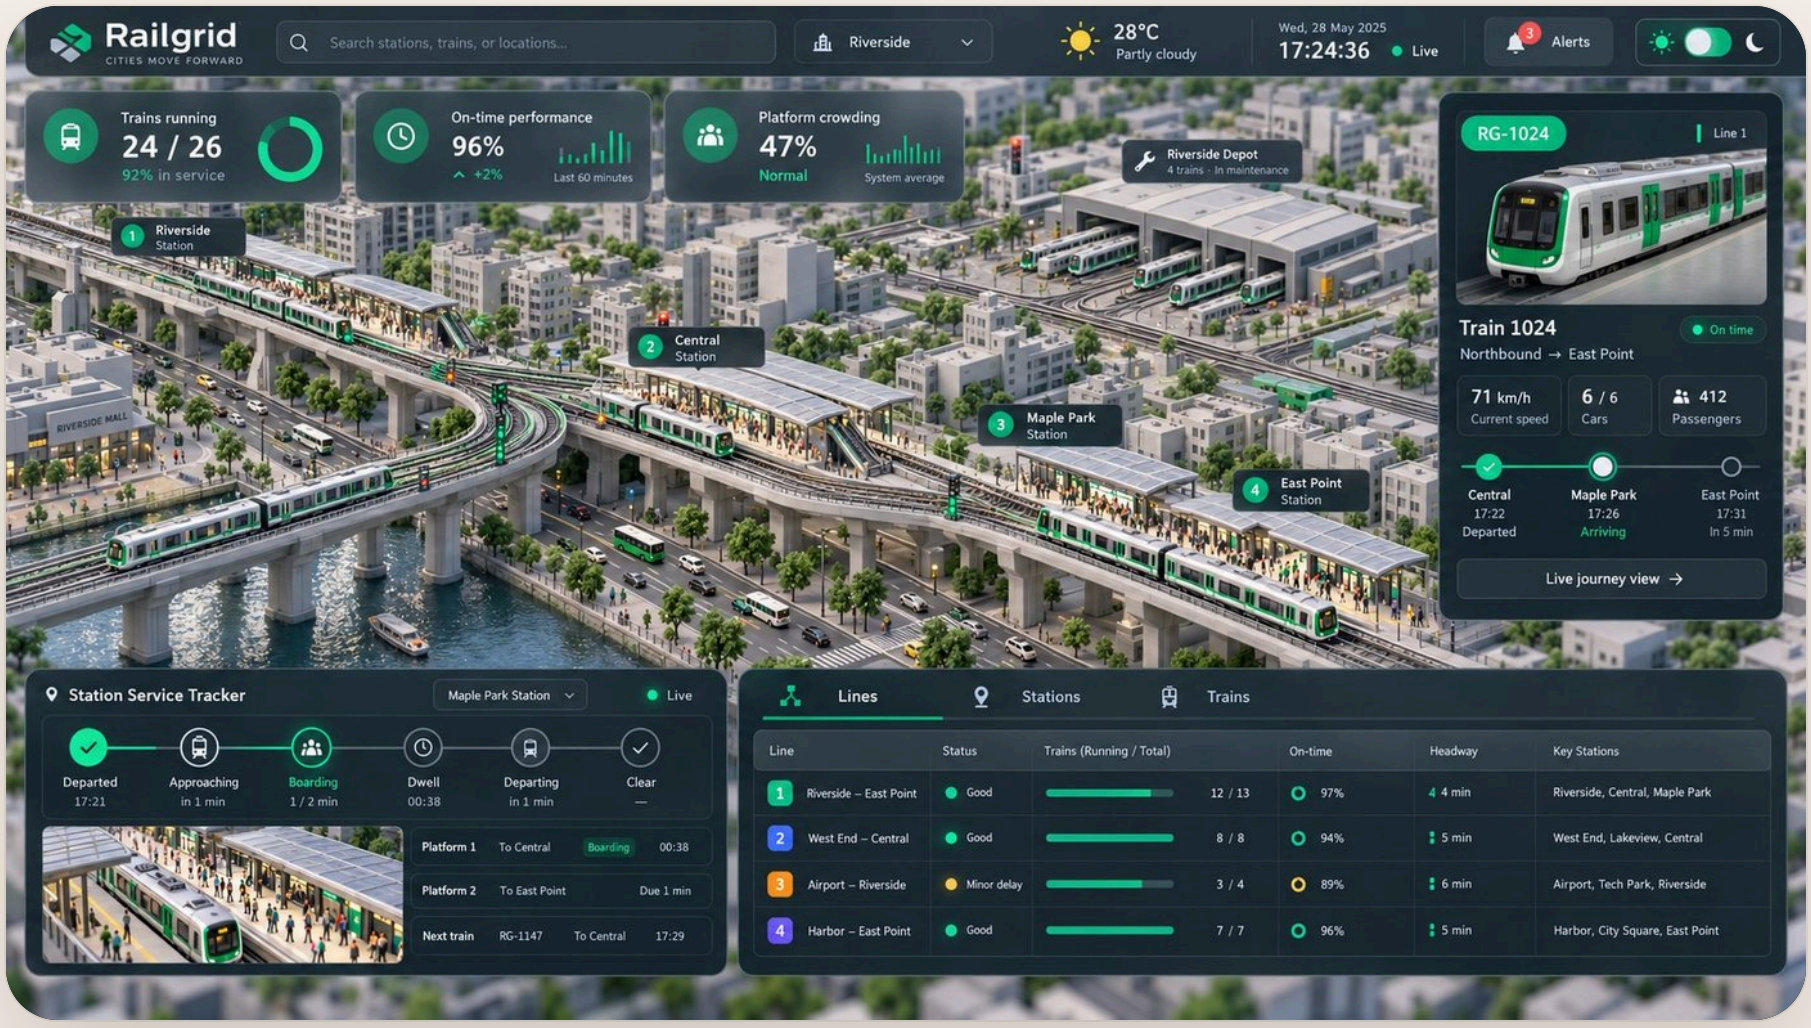

LIFE: an order pin drops on a building, a kitchen lights up, a rider on a scooter is assigned, picks up, rides there with a trail and marks it delivered with a small burst. Many riders run at once. Cars and auto-rickshaws obey traffic lights, everything gives way, nothing overlaps.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any rider, kitchen or building: the camera glides to it and follows a moving rider, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between neighbourhood zones.

DASHBOARD: frosted glass panels: top bar (logo, search for orders and riders, zone switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Orders this hour, Avg delivery time, Riders online), a right detail panel, a bottom-left order tracker (Placed, Accepted, Cooking, Picked up, On the way, Delivered) and a tabbed table (Orders, Riders, Kitchens). Realistic data: order IDs, dish names, rupee totals, distances in km.

EXTRAS: seasons (Summer, Monsoon with riders in raincoats and puddles, Festival night with string lights), animated day/night with street lights and headlights; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 06

Metro rail control

Railgrid #00A86B

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D metro rail control dashboard called "Railgrid" that feels like a strategy game.

WORLD: a low-poly isometric city slice built entirely in code, no external models. An elevated metro line with pillars, a curved junction, four stations with platforms, escalators and canopies, a depot with maintenance sheds, a river bridge, roads below with traffic, and city blocks. Clean toy-like clay look, one accent colour (#00A86B green) on light grey.

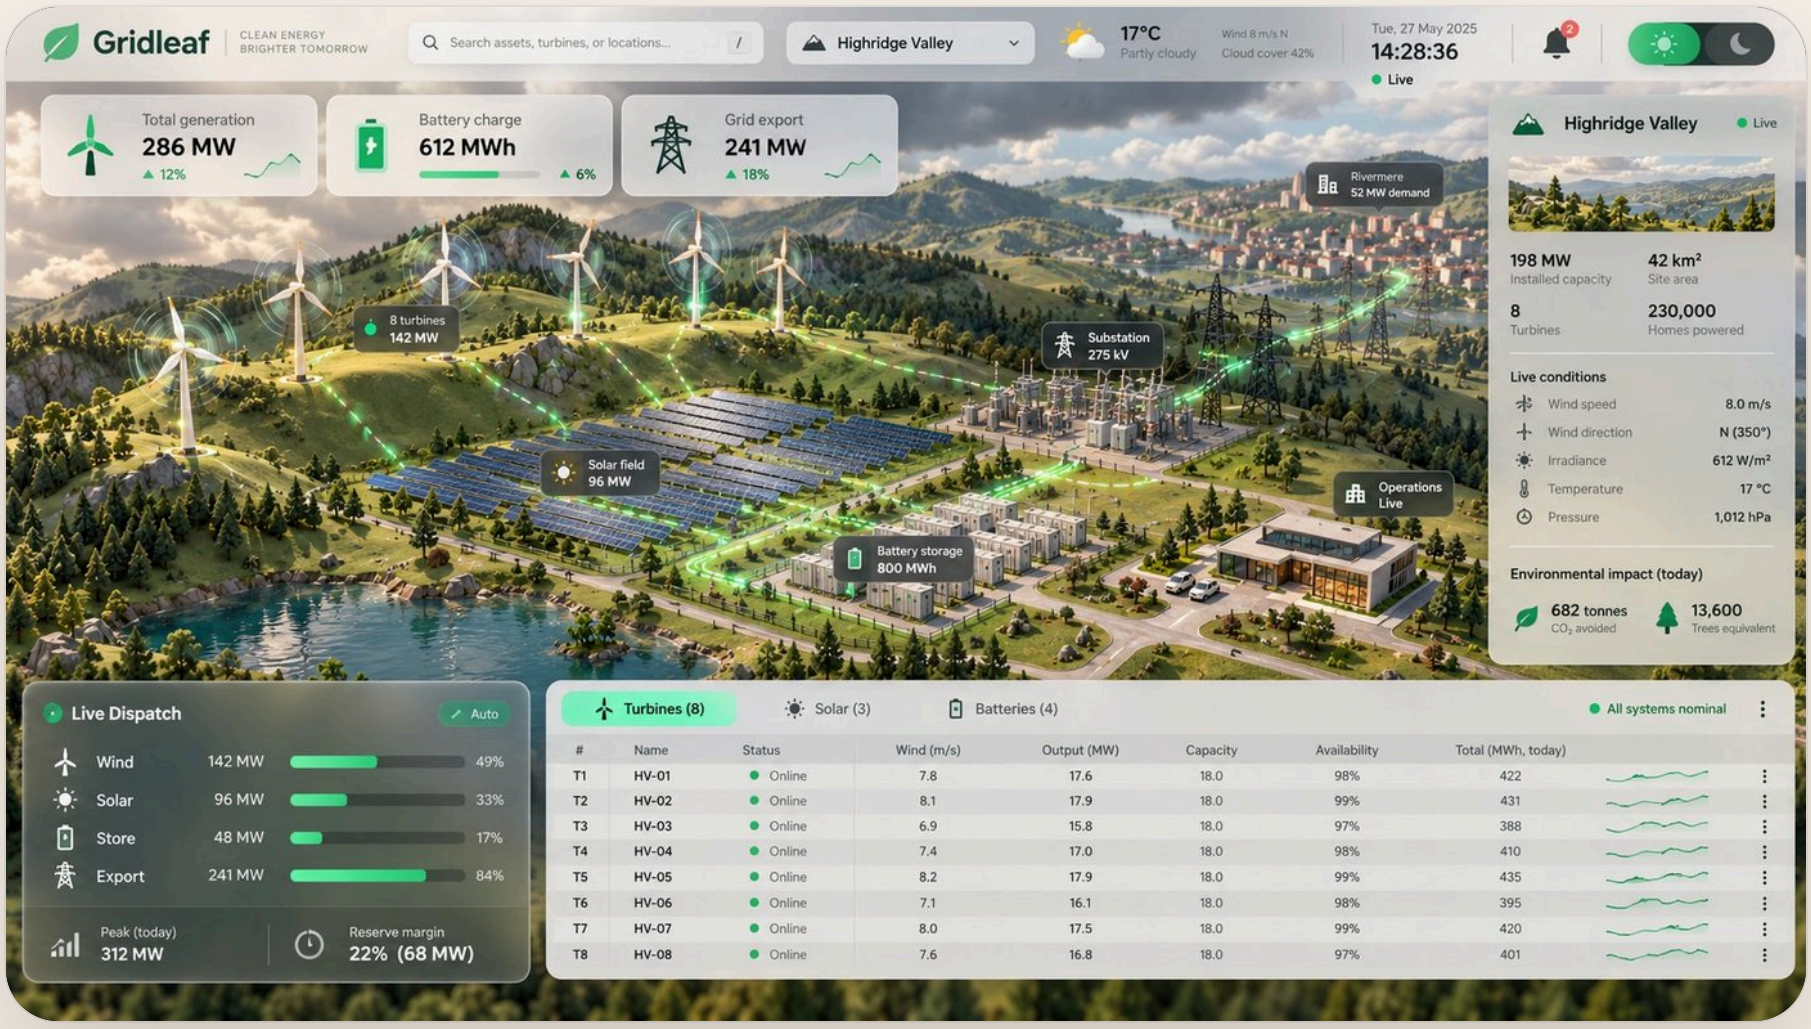

LIFE: trains run both directions on a timetable, slow into stations, open doors while passengers board and alight, then depart. Signals change colour ahead of each train. A train enters the depot for washing. Road traffic flows under the viaduct. Nothing ever overlaps.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any train, station or signal: the camera glides to it and follows a moving train, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between stations and the depot.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Trains in service, On-time %, Riders today), a right detail panel, a bottom-left journey tracker for the selected train (Depart, In section, Arriving, Doors open, Boarding, Depart) and a tabbed table (Trains, Stations, Signals). Realistic data: train numbers, headway in seconds, platform crowding.

EXTRAS: seasons (Clear, Monsoon with wet tracks and slower speeds, Fog, Festival rush), animated day/night with lit carriages and station glow; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 07

Wind and solar energy farm

Gridleaf #3DBE6E

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D renewable energy dashboard called "Gridleaf" that feels like a strategy game.

WORLD: a low-poly isometric landscape built entirely in code, no external models. Rolling hills with eight wind turbines on ridges, long rows of tilted solar panels, a battery storage yard, a substation with transformers and pylons leading to a distant town, an operations building, a gravel service road, a small lake and trees. Clean toy-like clay look, one fresh green accent (#3DBE6E) on light sage.

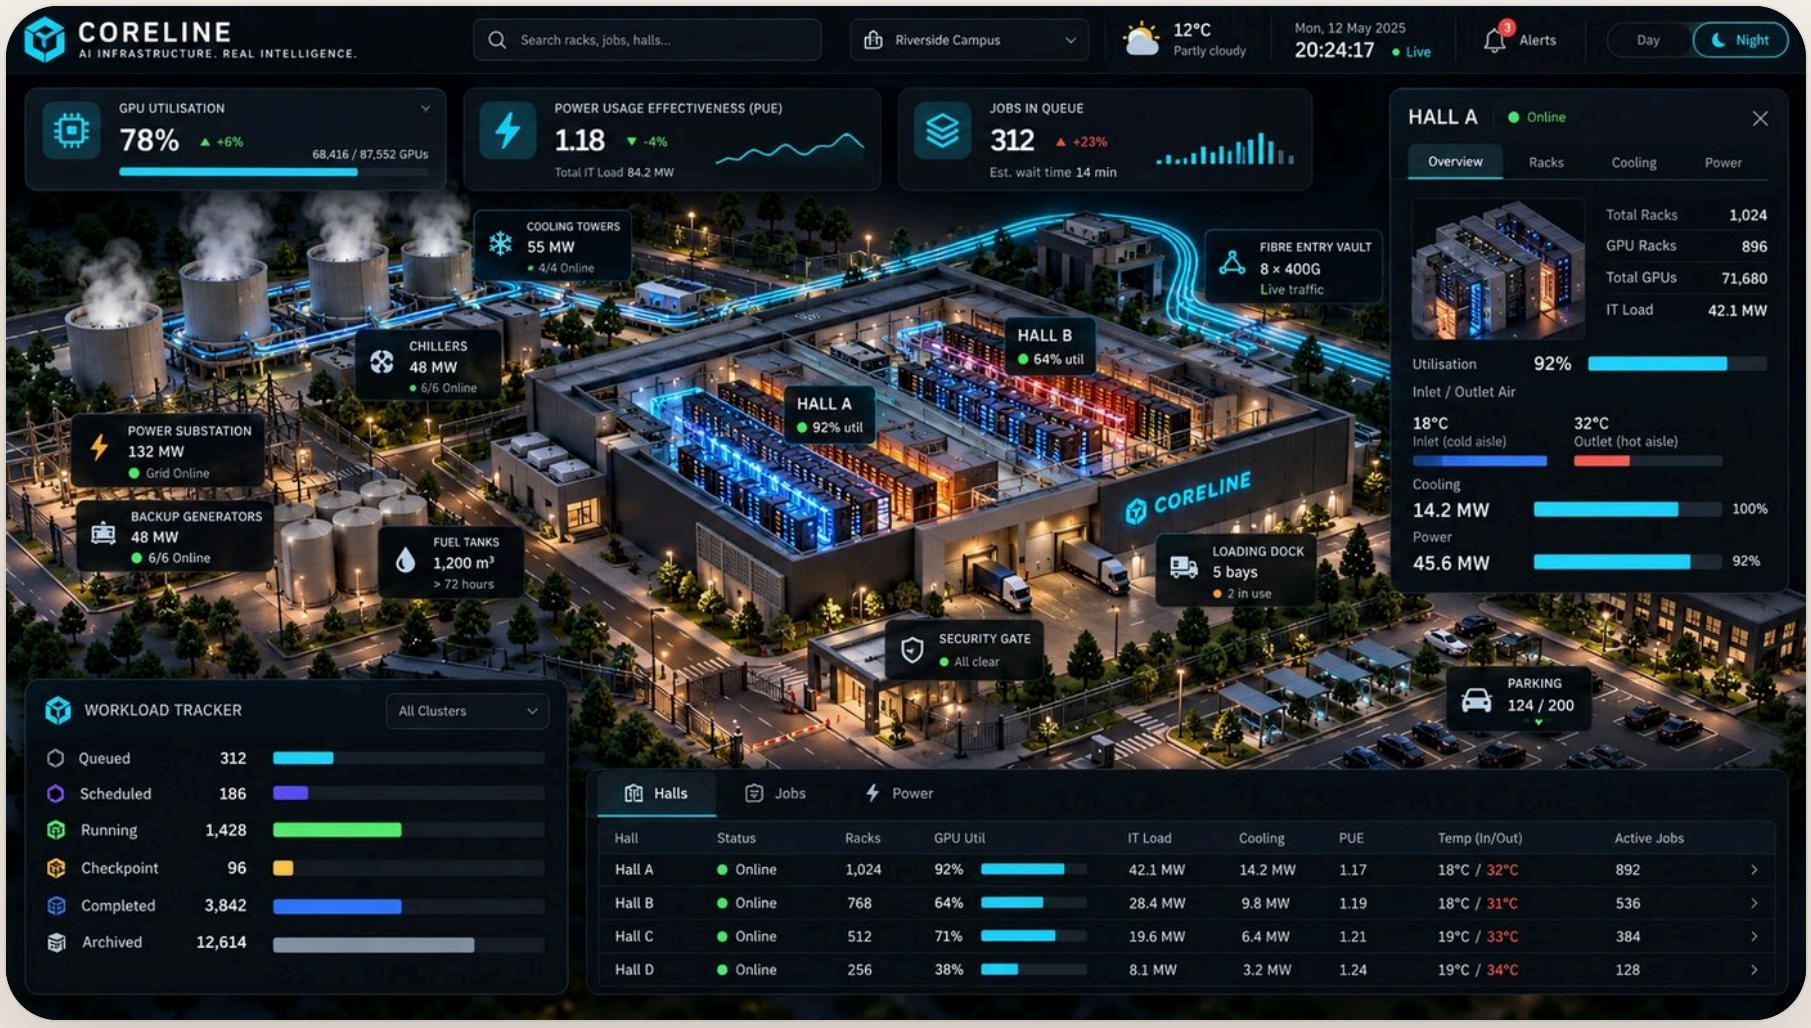

LIFE: blades spin at speeds tied to live wind values. Clouds drift and dim the solar rows they pass over. Glowing energy pulses flow along the lines into the batteries and on to the town. A maintenance van drives to a turbine flagged with a warning pin and fixes it. A drone inspects panel rows. Vehicles never overlap.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any turbine, panel row, battery, van or building: the camera glides to it, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Wind ridge, Solar field, Storage and Substation.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Live output in MW, Battery charge, CO2 avoided today), a right detail panel, a bottom-left maintenance tracker (Alert, Assigned, En route, On site, Repaired, Back online) and a tabbed table (Turbines, Solar rows, Crews). Realistic data: rotor RPM, wind in m/s, output in kW.

EXTRAS: seasons (Sunny, Windy, Monsoon, Winter haze); at night the solar rows go dark, batteries take over, turbine tip lights blink and the town glows; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 08

AI data centre

Coreline #22D3EE

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D AI data centre dashboard called "Coreline" that feels like a strategy game.

WORLD: a low-poly isometric campus built entirely in code, no external models, with a cutaway roof. Data halls with rows of GPU racks, hot and cold aisles, cooling towers with rising vapour, chillers, a power substation with backup generators and fuel tanks, a fibre entry vault, a loading dock, a security gate and parking. Clean toy-like clay look, dark mode first with one cyan accent (#22D3EE).

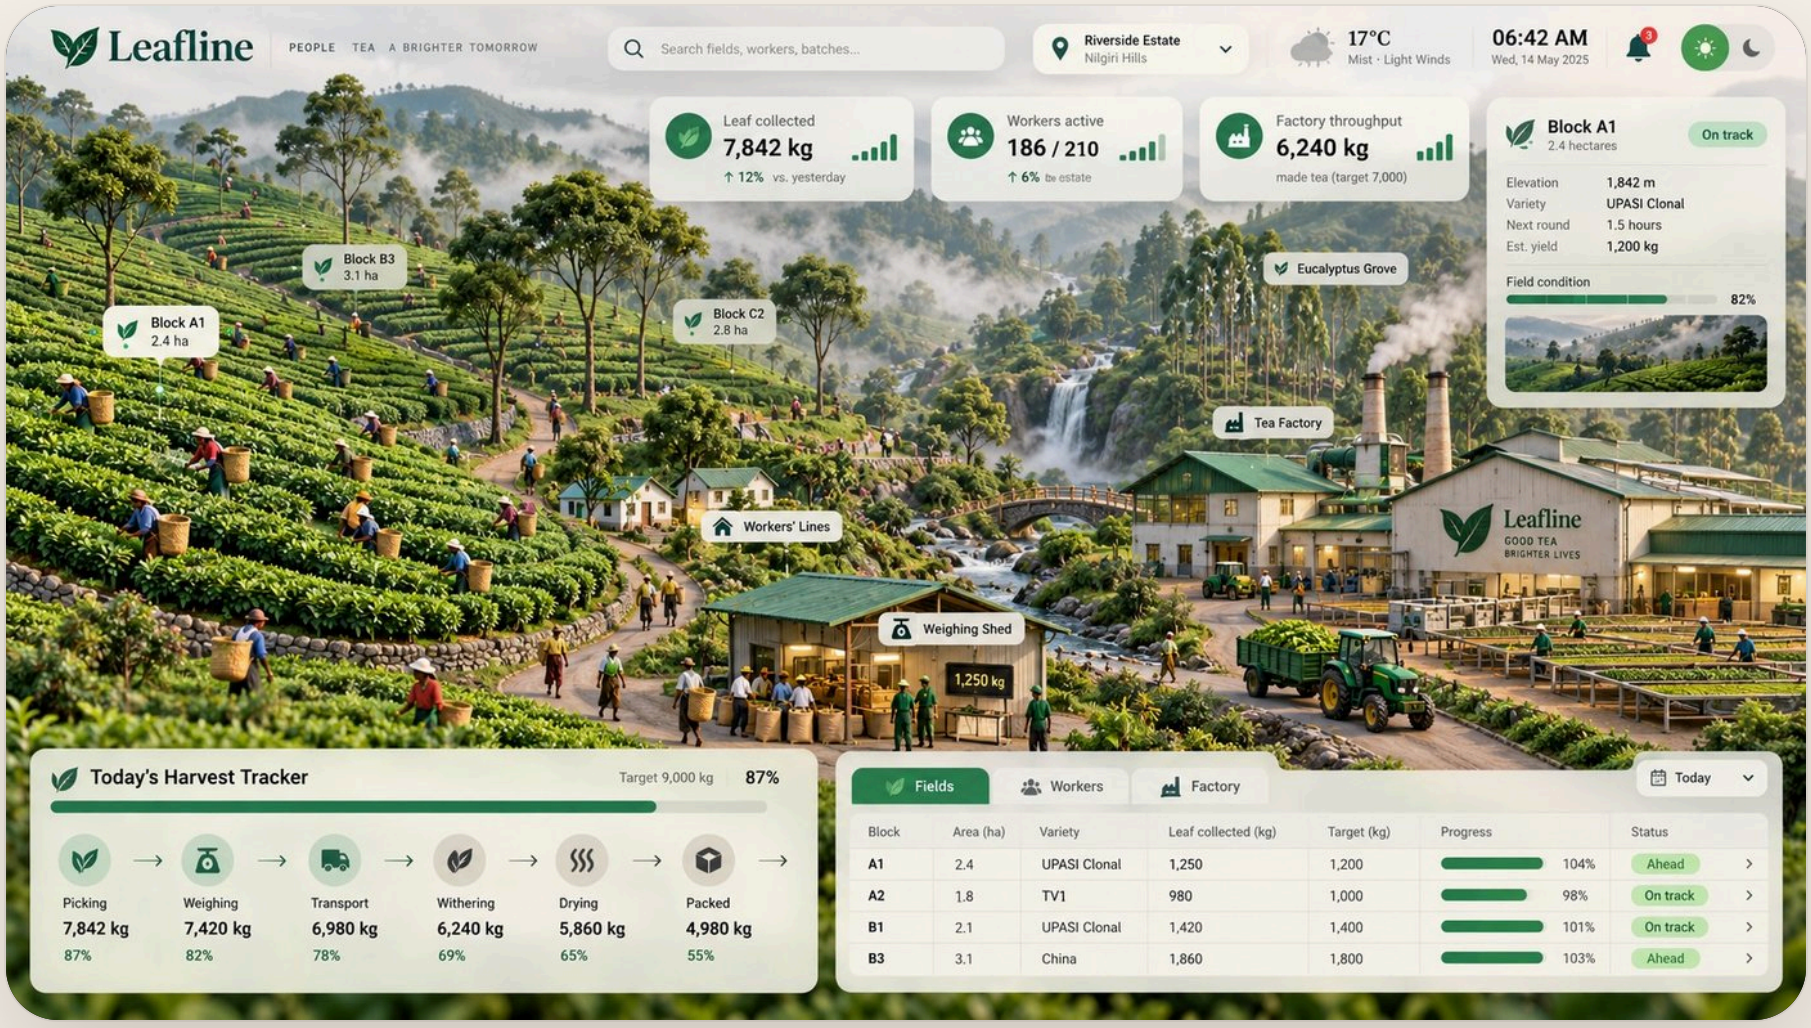

LIFE: rack LEDs pulse with load. Glowing data packets flow along fibre lines between halls. Jobs move from a queue onto racks and complete. Heat shows as a soft colour wash over busy aisles while cooling towers ramp up. A technician cart drives to a rack with a fault and swaps a node. A delivery truck unloads new servers.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any rack, hall, cooling tower, generator or cart: the camera glides to it, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Hall A, Hall B, Cooling, Power and Network.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (GPU utilisation, Power draw in MW, PUE), a right detail panel, a bottom-left job tracker (Queued, Scheduled, Running, Checkpoint, Evaluating, Done) and a tabbed table (Racks, Jobs, Incidents). Realistic data: rack IDs, temperatures in °C, kW per rack.

EXTRAS: weather (Clear, Heatwave with cooling at max, Monsoon, Storm with a generator test); animated day/night; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 09

Tea estate in the hills

Leafline #2F8F5B

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D tea estate dashboard called "Leafline" set in misty Nilgiri-style hills that feels like a strategy game.

WORLD: a low-poly isometric hillside built entirely in code, no external models. Terraced tea rows following the contours, shade trees, winding estate roads, workers' cottages, a weighing shed, a tea factory with chimneys and drying racks, a small waterfall and stream, and eucalyptus groves. Clean toy-like clay look, one deep green accent (#2F8F5B) on soft cream.

LIFE: pickers move along rows filling baskets, walk to the weighing shed, and a tractor with a trailer carries leaf to the factory. Spraying drones fly over rows. Factory chimneys puff. Mist rolls through the valley. Vehicles give way to people and each other.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any plot, picker group, tractor, drone or the factory: the camera glides to it and follows if it moves, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Upper slopes, Lower slopes, Weighing shed and Factory.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Leaf plucked today in kg, Factory output, Quality grade), a right detail panel, a bottom-left batch tracker (Plucked, Weighed, Withered, Rolled, Fermented, Dried) and a tabbed table (Plots, Workers, Batches). Realistic data: kg per plot, moisture %, grade names.

EXTRAS: seasons (First flush spring, Monsoon with heavy mist, Winter frost, Harvest sunshine); animated day/night with cottage lights; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 10

Hospital campus operations

Pulseway #0EA5E9

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D hospital operations dashboard called "Pulseway" that feels like a strategy game.

WORLD: a low-poly isometric hospital campus built entirely in code, no external models. A main tower with a rooftop helipad, an emergency entrance with ambulance bays, outpatient block, a cutaway ward floor with beds, operating theatres, a pharmacy, a parking structure, a garden courtyard and city roads. Clean toy-like clay look, one accent colour (#0EA5E9 calm blue) on clean white.

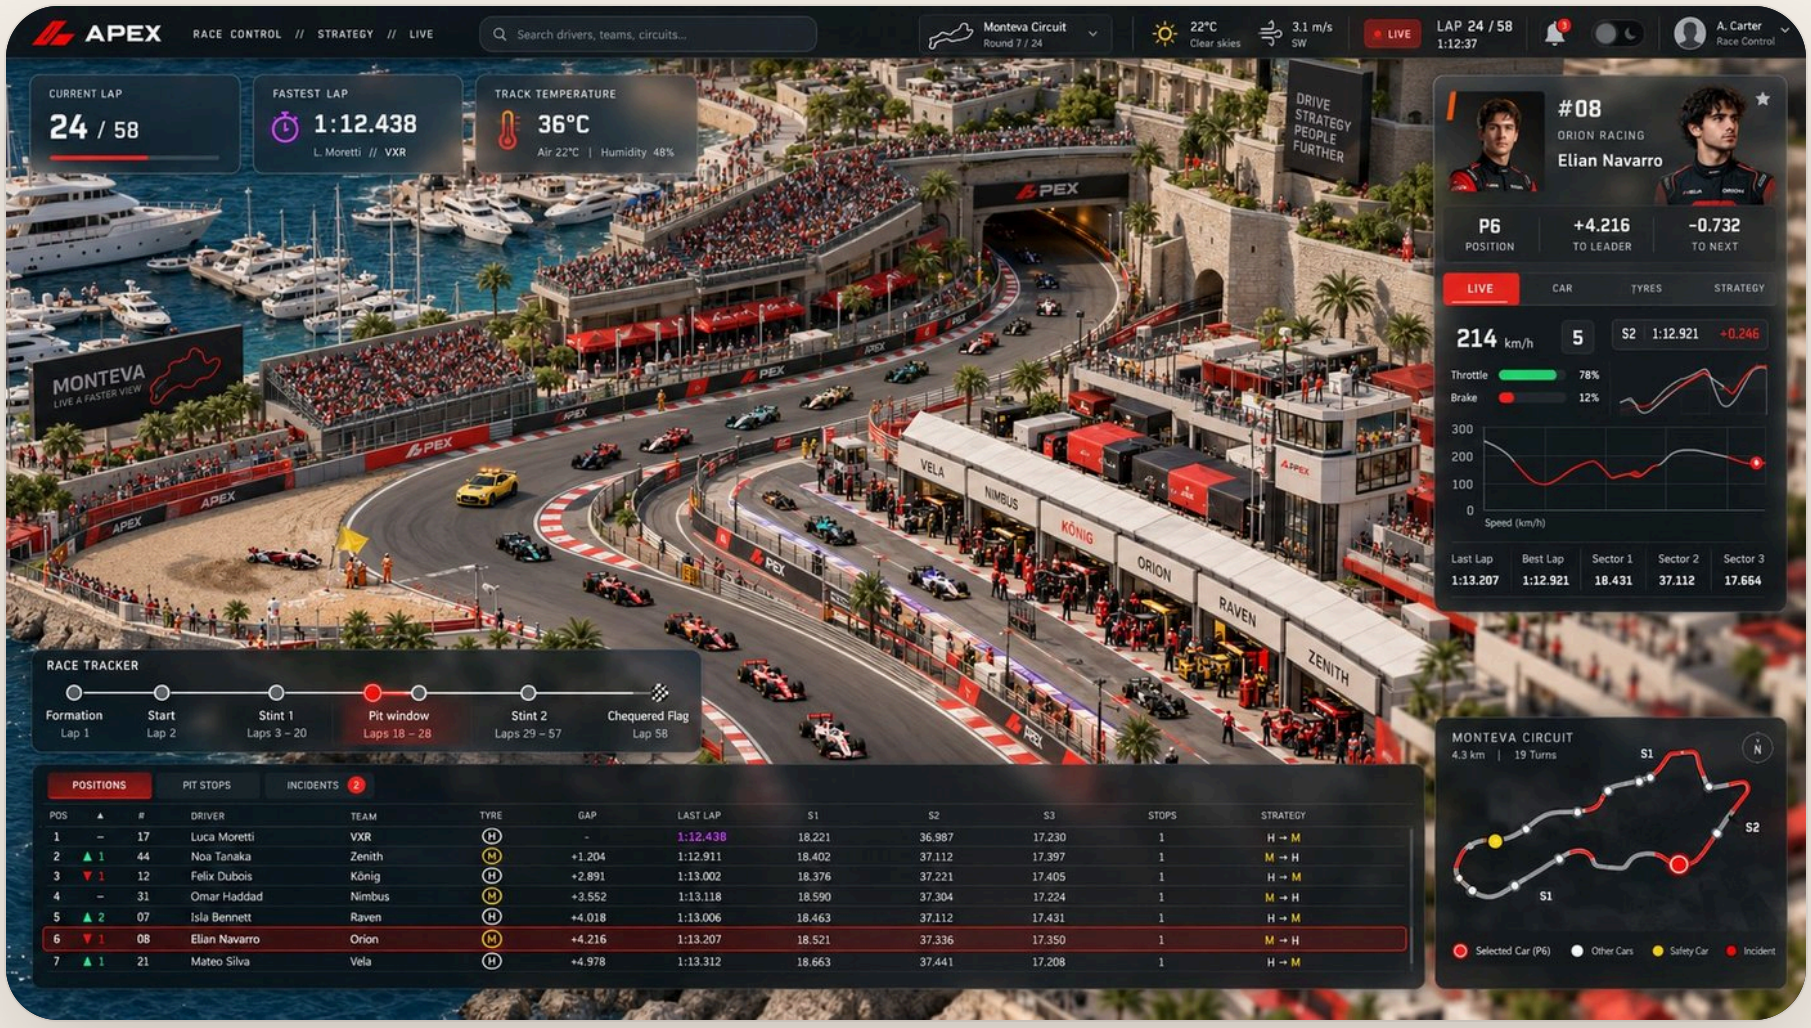

LIFE: ambulances arrive with flashing lights, patients are wheeled in and move through triage, scans and wards shown as small figures. A medical helicopter lands on the roof. Beds turn from free to occupied. Visitors walk through the garden. Traffic gives way to ambulances so nothing overlaps.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any ambulance, ward, theatre or the helipad: the camera glides to it and follows if it moves, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Emergency, Wards, Theatres, Helipad and Parking.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Beds available, ER wait time, Ambulances inbound), a right detail panel, a bottom-left patient flow tracker (Arrived, Triage, Assessment, Treatment, Admitted, Discharged) and a tabbed table (Beds, Ambulances, Theatres). Use anonymised case IDs only, no real names.

EXTRAS: weather (Clear, Monsoon, Fog, Heatwave), animated day/night with lit wards and helipad lights; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 11

Formula racing circuit

Apex #E10600

COPY THIS PROMPT

PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D race control dashboard called "Apex" that feels like a strategy game.

WORLD: a low-poly isometric racing circuit built entirely in code, no external models. A twisting track with kerbs, run-off areas and barriers, a pit lane with team garages, a race control tower, grandstands full of fans, a paddock with team trucks, a marina section and a tunnel. Clean toy-like clay look, one accent colour (#E10600 racing red) on warm grey.

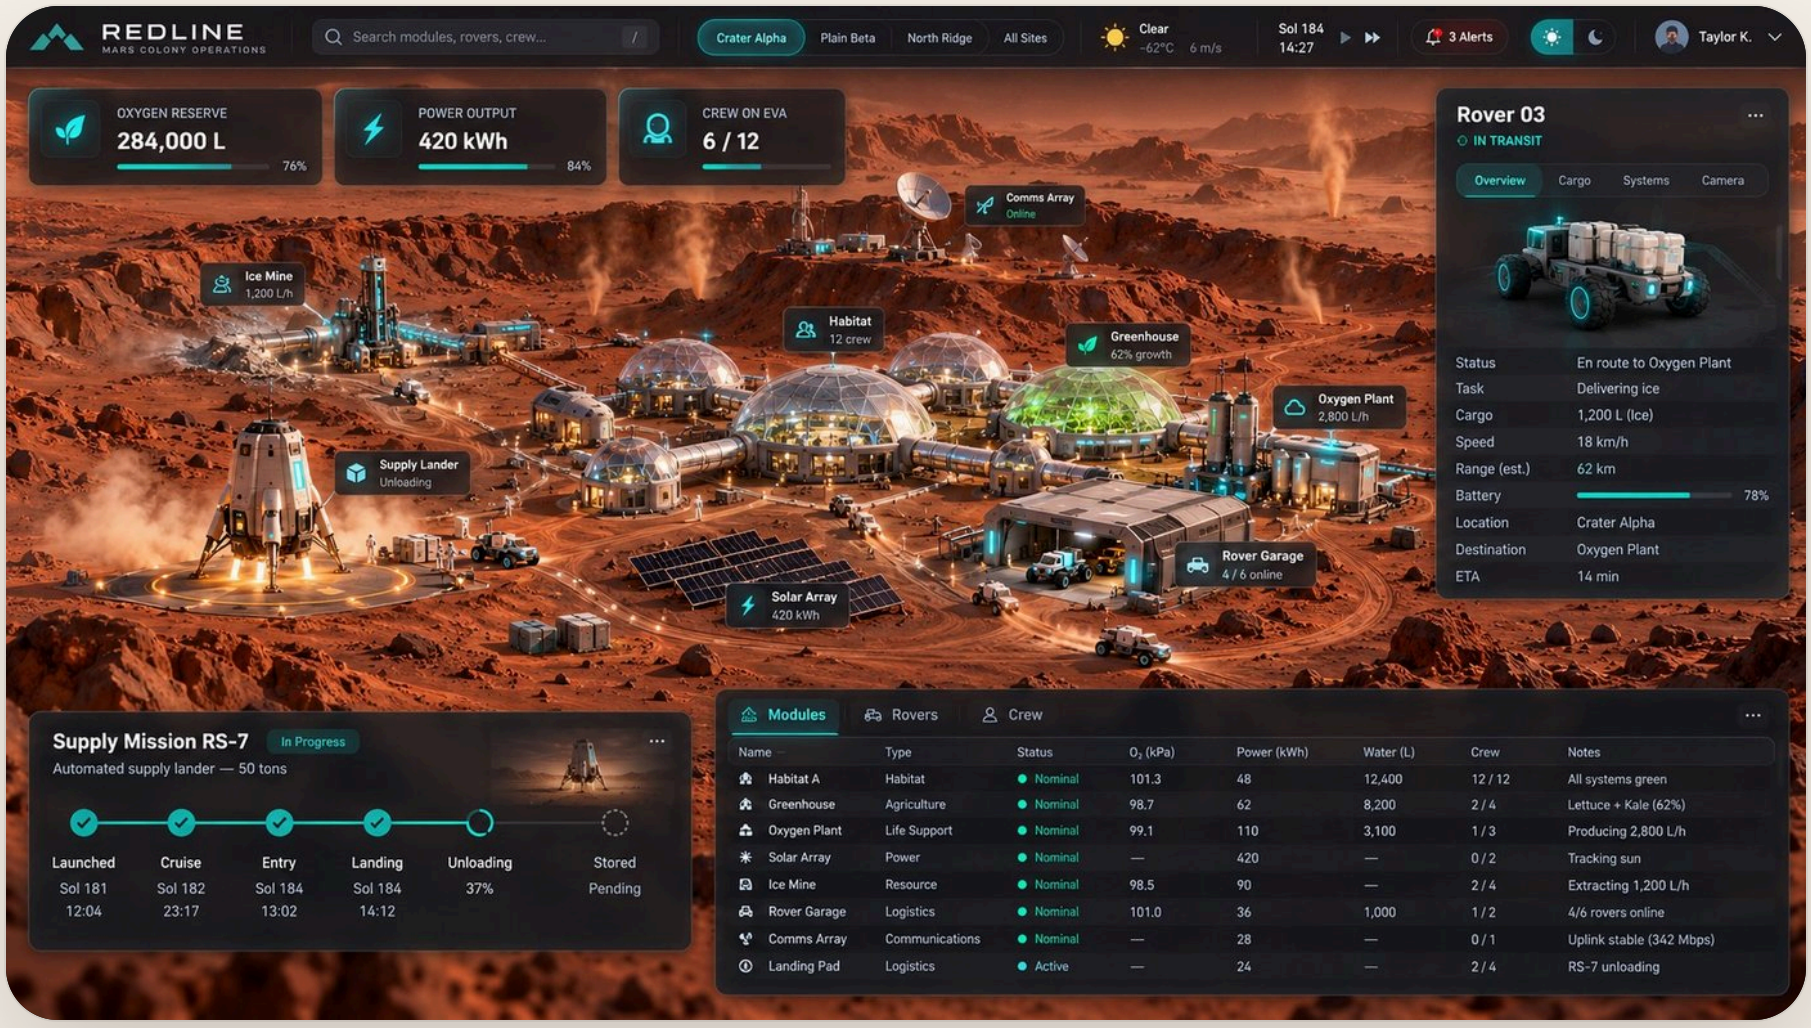

LIFE: twenty cars race on smooth racing lines with overtakes, slipstream and braking into corners. Cars pit and crews change tyres in a quick animated stop. Marshals wave flags at corners. A safety car appears when a car spins into the gravel. Pit lane traffic never overlaps.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any car, corner, garage or grandstand: the camera glides to it and follows a moving car, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Start/finish, Pit lane, Hairpin, Tunnel and Paddock.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live lap clock, alerts, day/night toggle, user), 3 KPI cards (Lap, Fastest lap, Track temperature), a right detail panel with a mini speed trace, a bottom-left race tracker (Formation, Start, Stint 1, Pit window, Stint 2, Chequered flag) and a tabbed live timing table (Positions, Pit stops, Incidents). Use fictional teams and drivers only.

EXTRAS: weather (Dry, Light rain with spray behind cars, Heavy rain with a red flag, Sunset); animated night race with floodlights; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 12

Mars colony base

Redline #14B8A6

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D Mars colony dashboard called "Redline" that feels like a strategy game.

WORLD: a low-poly isometric Martian crater built entirely in code, no external models. Habitat domes connected by tubes, a greenhouse glowing green, solar arrays, an ice mining rig, an oxygen plant, a rover garage, a landing pad, comms antennas, rocks and dunes. Clean toy-like clay look, rust orange terrain with one teal accent (#14B8A6).

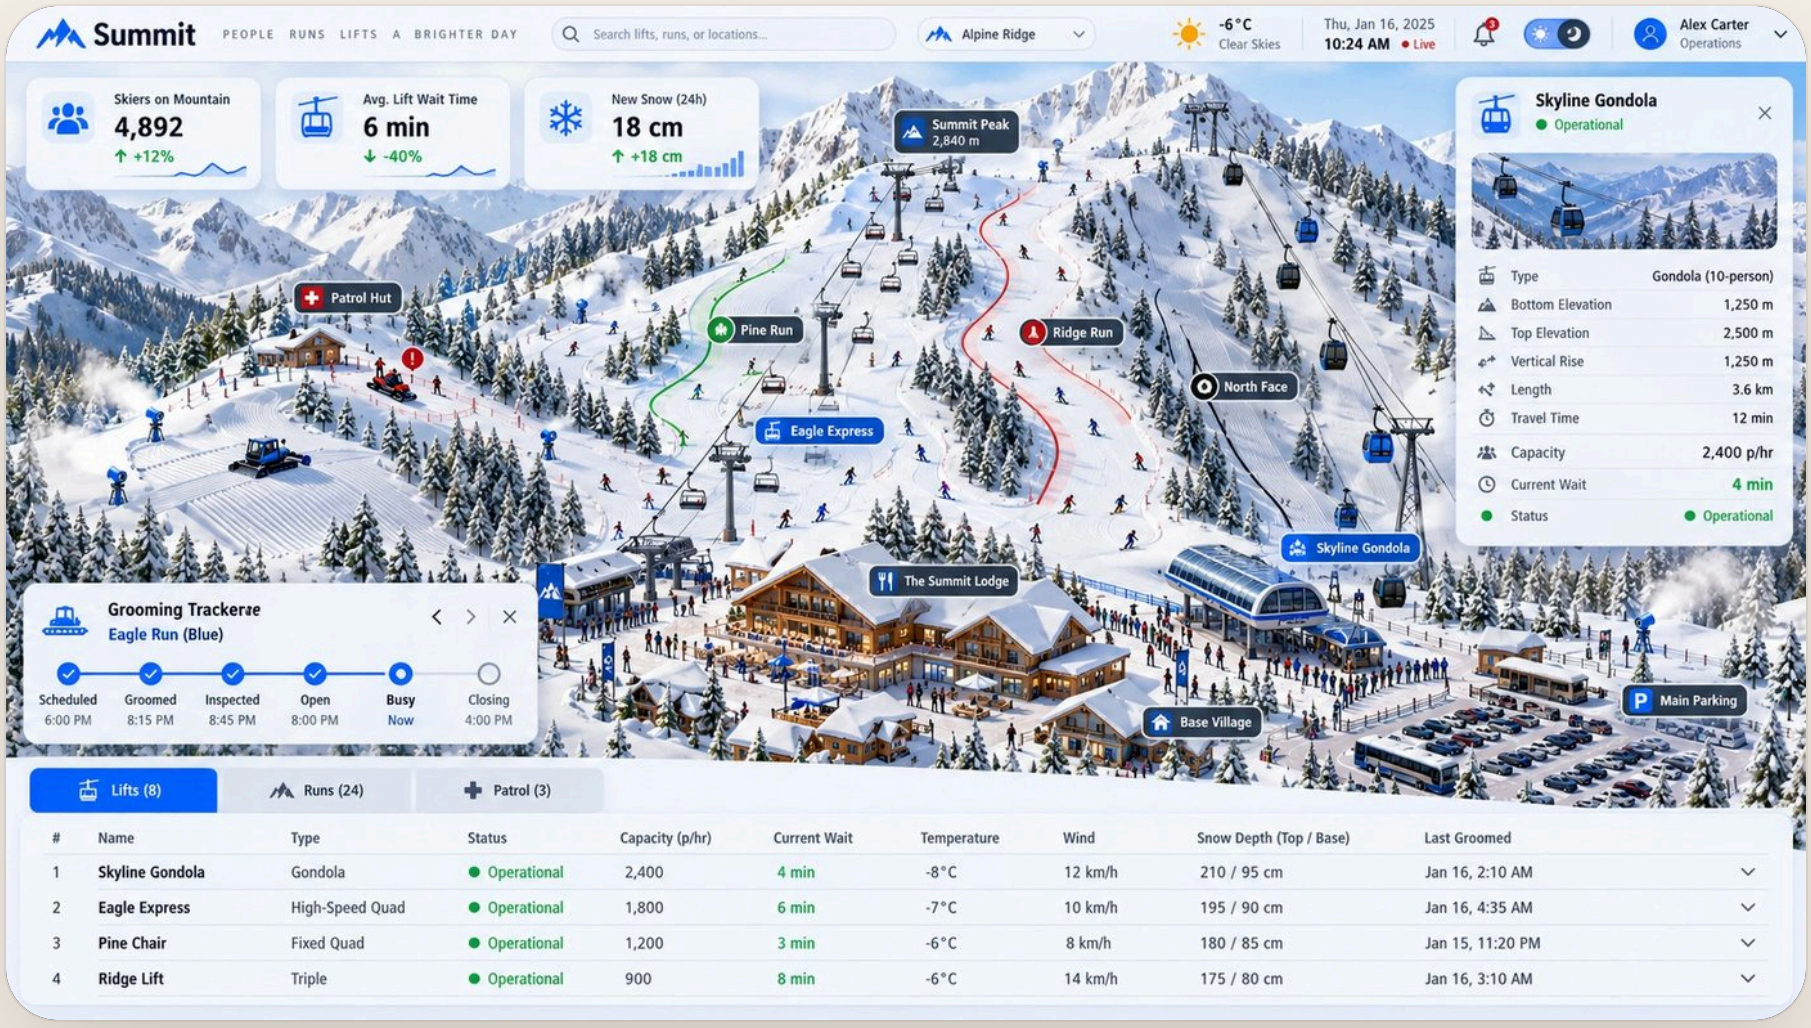

LIFE: rovers drive between the mine and the oxygen plant carrying ice. Astronauts walk between airlocks. Greenhouse lights pulse. A supply lander descends with retro burn and touches down, then a rover unloads it. Dust devils drift across the plain. Vehicles never overlap.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any dome, rover, astronaut or the lander: the camera glides to it and follows if it moves, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Habitat, Greenhouse, Mine, Power and Landing pad.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, Mars sol clock, alerts, day/night toggle, user), 3 KPI cards (Oxygen reserve, Power output, Crew on EVA), a right detail panel, a bottom-left supply mission tracker (Launched, Cruise, Entry, Landing, Unloading, Stored) and a tabbed table (Modules, Rovers, Crew). Realistic data: kPa, kWh, litres of water.

EXTRAS: weather (Clear sol, Dust storm with dimmed sun and orange haze, Frost dawn, Night with two small moons); animated day/night with glowing domes; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 13

Ski resort mountain ops

Summit #2563EB

COPY THIS PROMPT

PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D ski resort operations dashboard called "Summit" that feels like a strategy game.

WORLD: a low-poly isometric mountain built entirely in code, no external models. Ski runs of different colours, chairlifts and a gondola with towers, a base village with chalets, a lodge with a terrace, a snowmaking system, a ski patrol hut, a parking lot and pine forests. Clean toy-like clay look, one accent colour (#2563EB alpine blue) on snowy white.

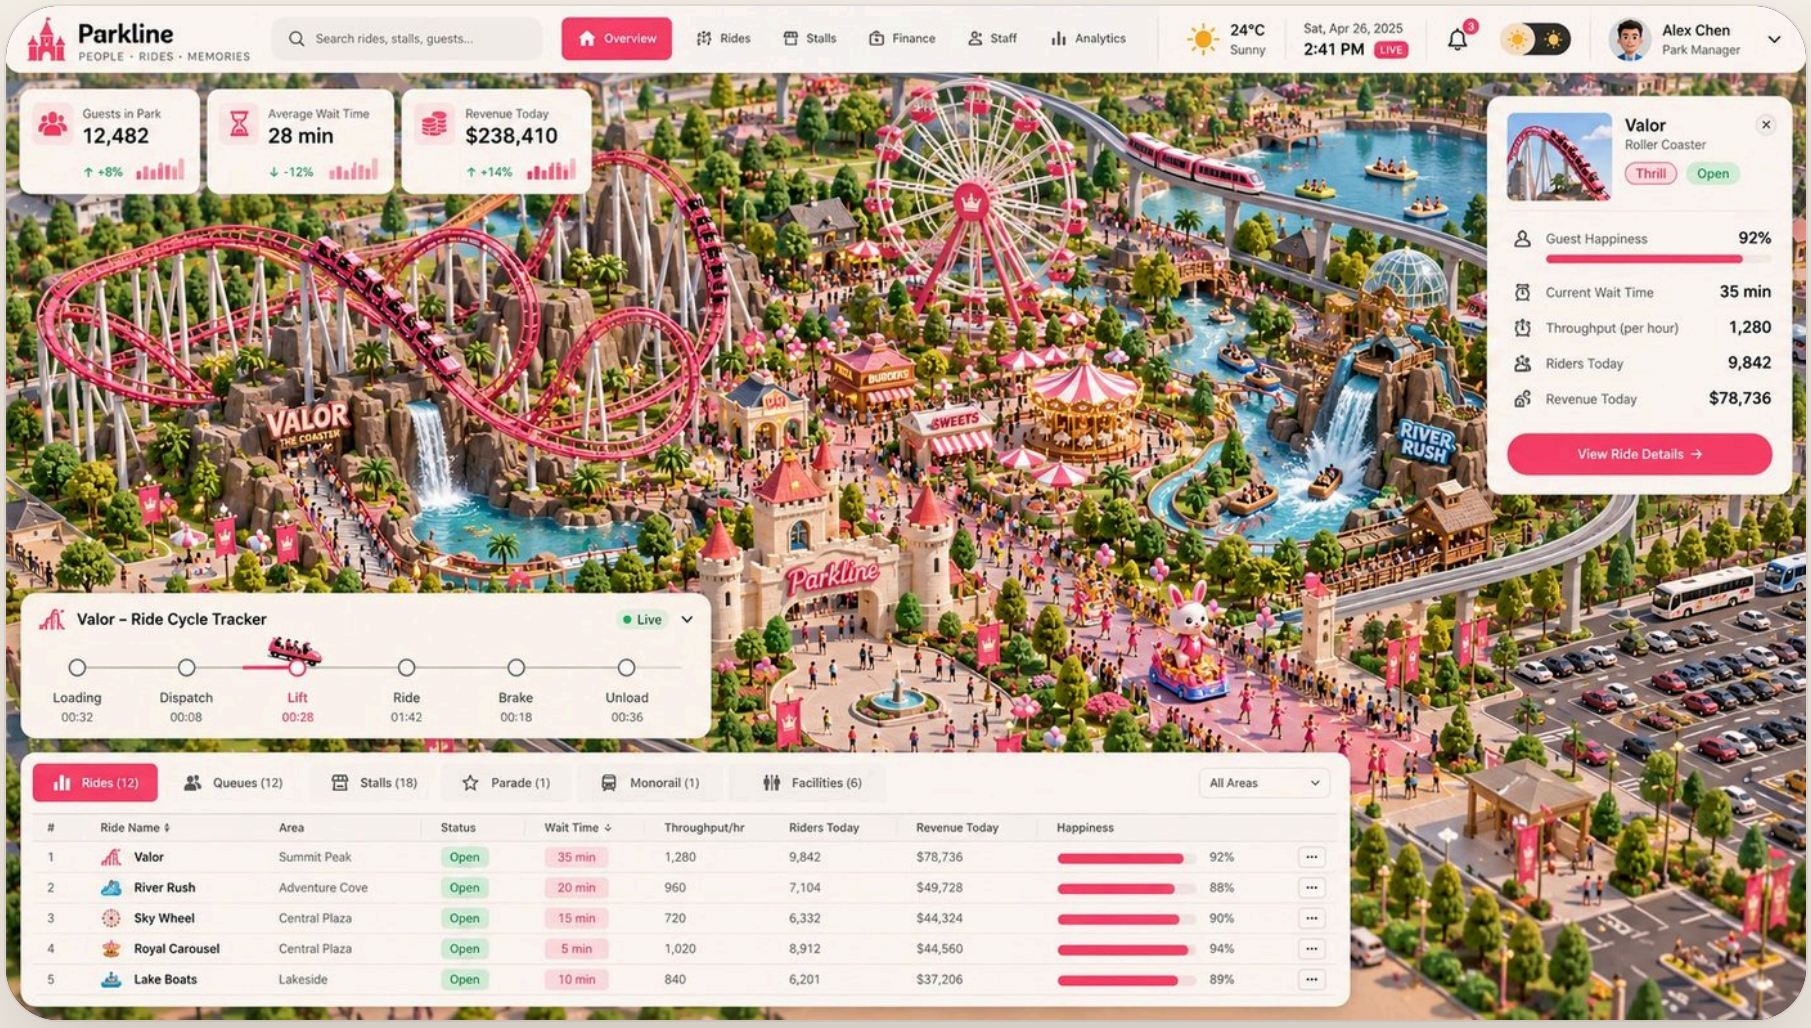

LIFE: chairs and gondola cabins loop up the cables. Skiers carve down runs in smooth S-curves and queue at lift bases. Snowcats groom runs leaving stripes. Snow cannons spray. Ski patrol rides a snowmobile to a flagged incident. Skiers and vehicles never overlap.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any lift, run, snowcat or the lodge: the camera glides to it and follows if it moves, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Base village, Summit, Main lift, Back bowl and Terrain park.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Skiers on mountain, Lift wait time, New snow in cm), a right detail panel, a bottom-left grooming tracker (Scheduled, Groomed, Inspected, Open, Busy, Closing) and a tabbed table (Lifts, Runs, Patrol). Realistic data: lift capacity per hour, temperatures, snow depth.

EXTRAS: weather (Bluebird, Snowfall, Whiteout with lift holds, Spring slush); animated night skiing with floodlit runs; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 14

Theme park operations

Parkline #F43F5E

COPY THIS PROMPT

PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D theme park dashboard called "Parkline" that feels like a theme park tycoon game.

WORLD: a low-poly isometric theme park built entirely in code, no external models. An entrance plaza, a roller coaster with loops, a Ferris wheel, a log flume with a splash drop, a carousel, food courts, a lake with paddle boats, a parade route, a monorail and parking. Clean toy-like clay look, one accent colour (#F43F5E candy pink) on warm cream.

LIFE: coaster trains climb, drop and loop; the Ferris wheel turns; logs splash down. Guests walk paths, join queues that grow and shrink, buy food and leave with balloons. A parade moves along its route at set times. The monorail loops above. Guests and service carts never overlap.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any ride, queue, food stall or the parade: the camera glides to it and follows if it moves, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Entrance, Thrill zone, Water zone, Kids zone and Lake.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Guests in park, Average wait, Revenue today), a right detail panel, a bottom-left ride cycle tracker (Loading, Dispatch, Lift, Ride, Brake, Unload) and a tabbed table (Rides, Queues, Stalls). Realistic data: riders per hour, wait minutes, ticket sales.

EXTRAS: weather (Sunny, Rain with umbrellas and closed water rides, Windy with coaster holds, Festive night with fireworks); animated day/night with ride lights; works on mobile.

@sanjai.builds

CONCEPT PREVIEW · YOUR BUILD WILL LOOK DIFFERENT

WORLD 15

Smart farm

Fieldmind #84CC16

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D smart farm dashboard called "Fieldmind" that feels like a farming strategy game.

WORLD: a low-poly isometric farm built entirely in code, no external models. Patchwork fields of rice, wheat and sugarcane, irrigation canals with water flow, a pond, a barn, grain silos, a dairy shed with cows, a greenhouse, a solar pump, farm roads and coconut palms. Clean toy-like clay look, one accent colour (#84CC16 lime) on warm earth tones.

LIFE: an autonomous tractor ploughs neat stripes, a harvester cuts a field and unloads into a trailer that drives to the silo. Spraying drones fly patterns over crops. Sprinklers turn on in dry plots shown by soil moisture colour. Cows walk to the milking shed. Vehicles never overlap.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any field, tractor, drone, silo or the dairy: the camera glides to it and follows if it moves, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between North fields, Paddy, Dairy, Greenhouse and Storage.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Soil moisture, Yield forecast in tonnes, Water used), a right detail panel, a bottom-left crop tracker (Sown, Germinated, Growing, Flowering, Harvest, Stored) and a tabbed table (Fields, Machines, Livestock). Realistic data: hectares, kg per hectare, litres.

EXTRAS: seasons (Summer, Monsoon with flooded paddies, Winter, Harvest gold), animated day/night with farmhouse lights and fireflies; works on mobile.

@sanjai.builds

Siren

Be the first to build this one.

WORLD 16

Emergency response city

Siren #EF4444

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D emergency command dashboard called "Siren" that feels like a city strategy game.

WORLD: a low-poly isometric city built entirely in code, no external models. A downtown grid with towers, a fire station with bay doors, a police station, a hospital, a river with a bridge, a highway, parks and residential blocks. Clean toy-like clay look, one accent colour (#EF4444 alert red) on cool grey.

LIFE: an incident pin appears (a small building fire with smoke, a traffic collision, a medical call). The nearest unit is dispatched: bay doors open, a fire truck drives out with lights, traffic pulls aside, crews arrive and the smoke fades as the fire is put out. Police cars patrol. Many incidents resolve in parallel. Vehicles never overlap.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any incident, unit or station: the camera glides to it and follows a moving unit, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Downtown, Riverside, Highway and Residential.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Active incidents, Average response time, Units available), a right detail panel, a bottom-left incident tracker (Reported, Dispatched, En route, On scene, Contained, Closed) and a tabbed table (Incidents, Units, Stations). Use fictional incident IDs only.

EXTRAS: weather (Clear, Monsoon flooding with water rising on low roads, Fog, Heatwave), animated day/night with flashing emergency lights; works on mobile.

Voltline

Be the first to build this one.

WORLD 17

EV gigafactory

Voltline #10B981

COPY THIS PROMPT — PASTE INTO CLAUDE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D EV factory dashboard called "Voltline" that feels like a factory tycoon game.

WORLD: a low-poly isometric factory built entirely in code, no external models, with a cutaway roof. A stamping press hall, a body shop with robot arms, a paint shop, a battery pack line, final assembly on a moving conveyor, a test track, a charging yard full of finished cars, a rail dock for parts and an office block. Clean toy-like clay look, one accent colour (#10B981 electric green) on clean white.

LIFE: a car body moves station to station: robot arms weld with sparks, it goes through paint, gets a battery pack lowered in, wheels fitted, then drives out to a short test lap and parks in the charging yard. Autonomous carts deliver parts along floor lanes and give way to each other. A train unloads parts at the dock.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any station, robot, cart or finished car: the camera glides to it and follows if it moves, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between Press, Body, Paint, Battery, Assembly and Test track.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (Cars built today, Line takt time, First pass yield), a right detail panel, a bottom-left build tracker (Stamped, Welded, Painted, Battery in, Assembled, Tested) and a tabbed table (Stations, Carts, Vehicles). Realistic data: VIN-style IDs, cycle times in seconds, kWh pack sizes.

EXTRAS: weather (Clear, Monsoon, Winter fog, Heatwave) affecting the outdoor yard and test track; animated day/night with factory window glow; works on mobile.

YOUR TURN

@sanjai.builds

Make your *own world.*

Fill the yellow blanks with any place you can imagine. A library, a zoo, a shipyard, your own city.

BLANK TEMPLATE

FILL AND PASTE

Build a single-file interactive web app (HTML, CSS and JS) using Three.js from a CDN: a live 3D **WHAT IT RUNS** dashboard called "**NAME**" that feels like a strategy game.

WORLD: a low-poly isometric **PLACE** built entirely in code, no external models. **8 to 12 landmarks, buildings and vehicles**. Clean toy-like clay look, soft shadows, one accent colour (**HEX**) on **BACKGROUND**.

LIFE: **the main loop, step by step**. **Other things that move**. Everything gives way so nothing ever overlaps.

INTERACTION: drag to pan, right-drag to rotate, scroll or pinch to zoom. Click any **OBJECTS**: the camera glides to it and follows if it moves, a ring and label mark it, and a glass panel shows live stats. An area switcher flies between **4 TO 5 AREAS**.

DASHBOARD: frosted glass panels: top bar (logo, search, area switcher, weather menu, live clock, alerts, day/night toggle, user), 3 KPI cards (**KPI 1**, **KPI 2**, **KPI 3**), a right detail panel, a bottom-left **PROCESS** tracker (**6 STEPS**) and a tabbed table (**3 TABS**). Realistic data: **UNITS**.

EXTRAS: seasons (**4 WEATHER MODES**); animated day/night; works on mobile.

FOLLOW-UPS THAT LEVEL IT UP

"Add a cinematic mode where the camera slowly glides between the most interesting areas."

"Some vehicles still overlap at junctions. Fix the give-way logic so they queue instead."

"Add a sandstorm weather mode with orange haze, low visibility and blowing particles."

"Make it run smoothly on a mid-range phone. Use instancing and cut draw calls."
